

SUSTAINABLE INFRASTRUCTURE SEMINAR

Infrastructure is the skeleton of the smart, climate-resilient city. Infrastructure is what connects each part of the economy into one whole. To create the right infrastructure, we need smart inputs. Development, financing, investing, building and operations need to be seamlessly aligned. The Infrastructure Seminar examines the approaches necessary for infrastructure stakeholders, from government to project managers, to achieve excellence within a context of global climate change, and also looks at the most financially sustainable infrastructure investments, including ICT, energy, water, waste and transport.
