

SUSTAINABLE MANUFACTURING SEMINAR

Manufacturers today have to find more water- and energy-efficient means of production, but consumers are increasingly demanding sustainably developed products. To compete at global scale, significant skills development is necessary. In order to develop a sustainable manufacturing sector, it is necessary to increase managerial competence, train numbers of sufficiently skilled workers, and improve the infrastructural environment overall. On the positive side, these challenges provide manufacturers the opportunity to adapt and thrive.

The Manufacturing Seminar looks at how sustainability can be built into the manufacturing environment and the opportunities that the green economy offers the manufacturing sector, with an emphasis on concrete incentives and special economic zones.
